Your Images Stay on Your Mac

Privacy statement for Infinite Nodra, exported panels and the Infinite Nodra Player · November 2026

In short: Infinite Nodra and the Photoshop panels made with it edit images only on the user's own Mac. Exported panels have no internet access at all. Images, file names and settings are not uploaded.

Exported panels

A panel exported from Infinite Nodra and passed on to others cannot connect to the internet:

- Photoshop grants it no network permission.
- It contains no license check and no account.
- Nodes that could use the internet (API node, RTMP input) are blocked in it and send nothing.

Images, file names and settings of the people who use such a panel never leave their Mac.

Infinite Nodra Player

On the internet, the free Player connects to one server only: the Infinite Tools license server (api.infinite-tools.com), to activate and confirm its license. It sends the license key, a machine ID, the computer's name and the version number. It never sends images, file names or patches. If it is linked with Infinite Nodra, it also talks to Infinite Nodra on the same Mac. Network nodes are blocked in the Player as well.

Infinite Nodra (the app)

- Every node computes on the Mac, the AI nodes included. Only the API node described below sends data elsewhere.
- AI models are downloaded only when the user chooses to install them; after that they work offline.
- Two nodes can use the internet on purpose: the API node sends data to a web service the user chooses, the RTMP input receives a live stream. Nodra asks before the first connection to each server.
- API keys for web services stay in the Mac's keychain and are never saved in a patch.
- Nodra itself goes online only to activate and confirm the license, to check for updates, and to list and download AI models.
